

In development, no releases yet

One folder, spread across every machine you own.

A file sync tool for Linux and macOS that runs over your tailnet. No accounts, no config file, and built from the start never to lose a file.

\$ curl -fsSL https://delocal.sh/install | sh

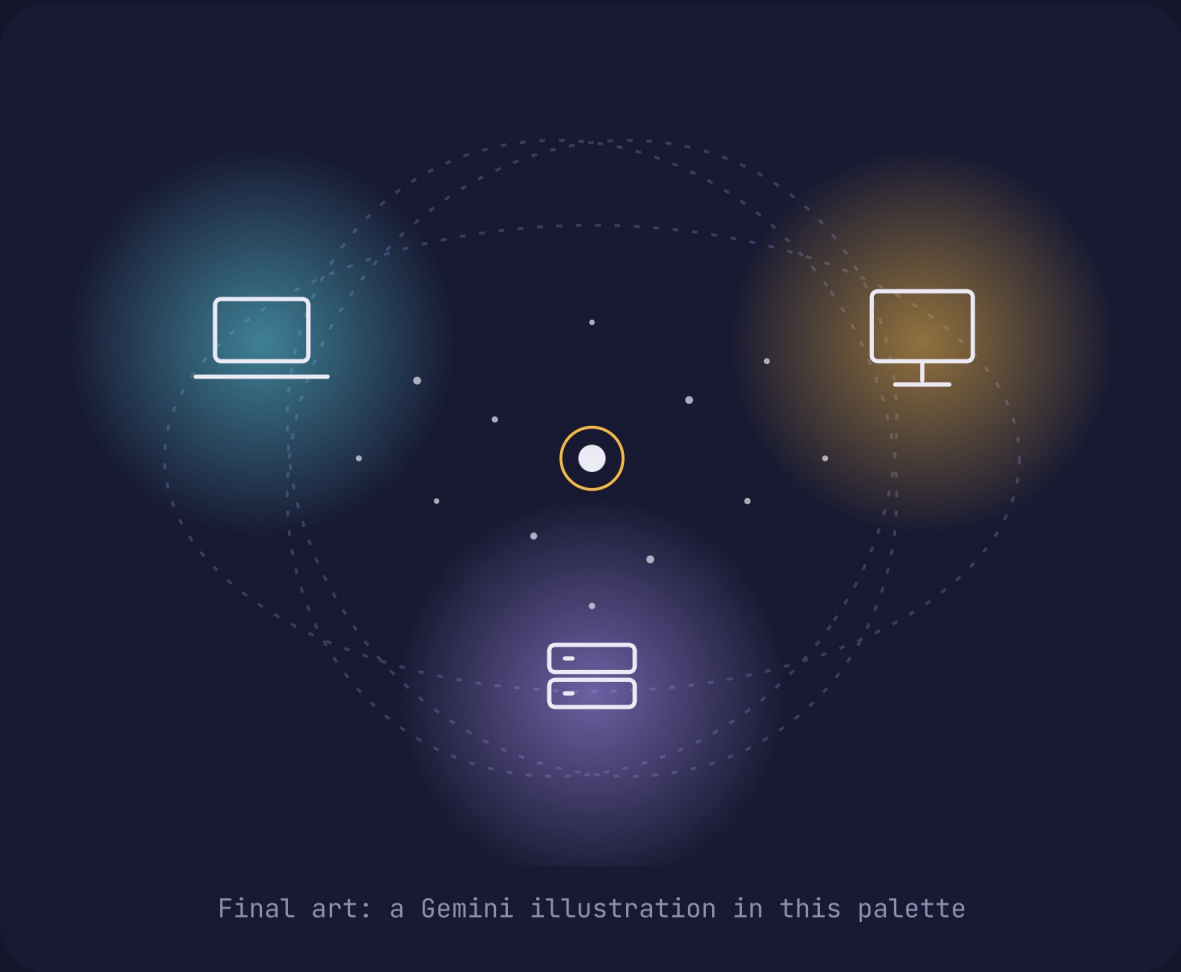

Copy

Needs Tailscale. Linux and macOS.

```
~/Sync illustrative

~/Sync > delocal uptailnet  connected as dyllan@
folder  ~/Sync  1,204 filespeers  ● laptop  ● desk  ● nas
14:02:11  nas    ↓ photos/2026-09/ (38)
14:02:14  desk    ↑ thesis/draft-4.tex

✓ in sync with 3 peers
```

Like a delocalized particle, your files are in every place at once.

- Runs over your tailnet**
Machines find each other through Tailscale. Nothing passes through anyone else's server.
- Nothing to set up**
No accounts, device IDs or config file. Install it, then run one command in the folder.
- Every machine is equal**
A full mesh: any machine can go offline, and the others carry on.

Built never to lose a file.

When one machine goes wrong, the damage stops there instead of spreading to the rest.

- trash** Files replaced or deleted by another machine are kept locally first.
- hold** Mass changes wait for your approval before they reach other machines.
- revert** Undo the damage a machine did before anyone else saw it.

```
~/Sync illustrative

~/Sync > delocal status✓ laptop, nas  in sync
■ desk          412 deletes held

desk deleted 412 files in 9 seconds.
They have not spread to your other machines.

keep them:  delocal approve desk
undo them:  delocal revert desk
```

Two commands per machine.

1 Install

\$ curl -fsSL https://delocal.sh/install | sh

2 Start syncing the folder you're in

\$ delocal up

Run the same two on your next machine and they find each other. [Read the docs](#) for more.

Follow the build.

delocal is being built in the open, with every design decision in the repo.

••• de1ocal

A file sync tool being built to keep one folder the same on all your Linux and macOS machines, over Tailscale.

- In development. There are no releases yet, so there is nothing to install.

github.com/dyllan-p/de1ocal
